mailsite®

MailSite Use Case:

Project Extranet

Greg and Helen both work for a small software business. They like to run the latest software, so they manage their mail, contacts and calendars in Classic Outlook for Windows.

Greg and Helen just started working on a new project with consultants from outside their company. They need to share their work calendars both with other employees and with the consultants. The consultants each have their favorite calendar app, such as Apple Calendar, Outlook or Google Calendar.

Greg and Helen's calendars are kept on their company's MailSite 11 server, so Outlook and ExpressPro webmail show the same events. Colleagues get direct access through calendar sharing and see the calendars in their own Outlook or ExpressPro. For the consultants, Greg and Helen publish a view of their calendars in ExpressPro and simply send the link. It can show busy times only, so project details stay private. Any app that reads the popular iCalendar format, even Google Calendar, can subscribe to it. When the project ends, they revoke the link.
